ANSWERS, INSIGHTS AND CONCLUSIONS

1.1) What is the period when these ratings were collected? The ratings were collected between the 01-01-2021 and the 14-02-2021.

1.2) What is the distribution of the number of received ratings per user? The distribution of the number of received ratings per user corresponds to a positively (non-symmetric) skewed normal distribution.

1.3) What is the average rating value? The average rating value is 4.904.

1.4) What differences are there between ratings SellerToBuyer and BuyerToSeller? The difference between the SellerToBuyer and BuyerToSeller transactions is only in the number of reviews. Sellers leave on average 40% more reviews than buyers.

A) The average number of transactions per user is 1.04 (97% of the total number of transactions). This tells us that this dataset might come from an online marketplace (most likely a C2C platform). All the users with 2 (2% of the total number of transaction..

B) Most users leave a very high rating (4.9/5.0) on all the transactions, which means that the platform works well and the experiences are very positive. This also explains why despite having an excellent experience selling or buying, most users who sell/buy n..
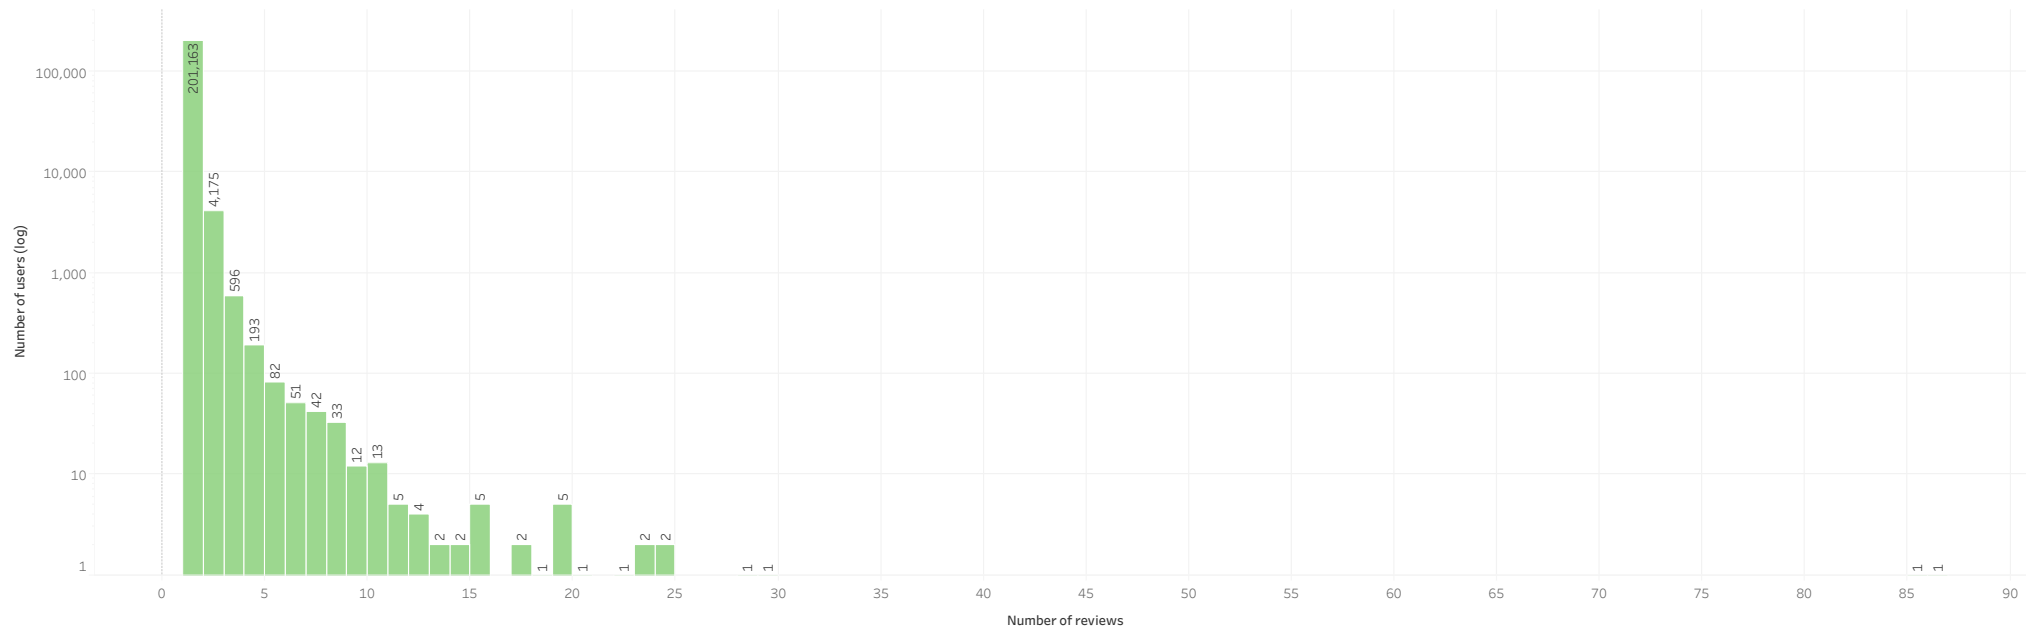

C) On special days (New Year's Day, after Kings' Day and St. Valentine's Day) there is a considerable drop in the number of transactions (and correspondingly ratings) due to holidays. A slight decrease is also perceivable on Sundays. The highest number of ratings usually ..

D) According to the model, it is possible to classify the users of the platform into 3 types:
-NON-PROFESSIONAL BUYERS/SELLERS: Non-professional users that make a normal use of the platform.
- HEAVY BUYERS: Non-professiona..

Rating Type
- Buyer to Seller
- Seller to Buyer
